Rubrica

Learning a black box, one proven rule at a time.

Kevin Vicent · github.com/moebious/rubrica · blackbox.rubrica.dev

Architecture: reason offline, execute exactly

Rubrica maintains a model of the black box, not a fixed copy: System 2 learns it · the ontology versions it · System 1 runs the current version

site/diagram.png (submitted 12:00) · replica live at blackbox.rubrica.dev

THE DESIGN AT WORK

Each part of the diagram caught something

Design component	What it caught	Status
Drift canary	Service v2 between 15:50 and 16:00: balance format, transfer limit, lockout	3 rule changes, v1 kept
Held-out set (anti-Goodhart)	Two Authorization headers: the first one decides; replica said 401	18 probes, fixed
Probe gate: hypothesis + prediction	Hidden HALT command, suggested by the service itself: 409 E520	Confirmation never sent
Probe gate: targeted words	Suggestion ties: PITA gets ALTA, not PING (alphabetical)	38 probes, fixed
Coverage gaps	/msg?test=1 is 200 on the original; replica routed it to 404	Fixed

Open gap: the spec is still a curated claims list, not generated from the rule registry.

INCIDENT FR-0153 · SERVICE V2

The incident became three data fields

Change	V1	V2	Confidence
Balance format	40000	"400.00"	confirmado (11, 1164)
Transfer limit	100000	50000	confirmado (13, 1026)
Lockout after failures	not tested	3 → 423 E510	probable change (1059, 1060)

```
V1 = Policy("v1-observed", 100000, False, None)
V2 = Policy("v2-observed", 50000, True, 3)
```

Canary matched at 15:50, differed at 16:00. Lockout absence in v1 was never tested, so we do not claim it.
